Unit Mounted

640652

PART No. DESCRIPTION

7137	Unit mounting coulter support
11512	Hub Disc
11513	Bearing (6204 -2RS)
11515	Spacing Ring Coulter
11519	Spindle, Coulter blade
11527	Coulter blade, 14'
640652	Complete Coulter

SPACERS

Front and Rear Spacers are used to hang accessories from a 2" x 2" diamond toolbar. The spacers are mounted on the 5" x 5" main frame toolbar.

PART No. DESCRIPTION

900034.2	Front spacer, 2" x 2" Diamond bar for 7 x 7 planter.
900033.1	Rear spacer, 2" x 2" Diamond bar for 7 x 7 planter.

CLOD REMOVERS

The function of the clod remover is to clear the surface of the soil, but not plow a furrow. It is rigid and mounted in front of the disc openers that push clods away in preparation for the seed trench. The front brace of the clod remover is an independent adjustable opening knife that used to slice open hard soil and move stones away from the track of the disc opener. The clod remover should be adjusted according to soil type. The use of a clod remover in very rocky soils may be a problem due to clogging and blocking. In that event, it is better to mount a flexible support bracket for the clod remover as shown below.

PART No. DESCRIPTION

7101	Front point, clod remover
7102a	Mounting bracket, clod remover
7103a	Clod remover
10512018	Bolt , 10x35
650996	Complete clod remover

OPTIONAL EQUIPMENT

RESIDUE MANAGER

Residue managers are available for minimum and no-till situations.

PART No. DESCRIPTION

Y2967-109	Residue manager assy complete w/ mnt bracket
F13110	Bolt, 3/8 -16 x 1 3/4 Gr. 5
F13209	Bolt, 1/2- 13 x 1 1/2 Gr. 5

ROW MARKERS

7" x 7" Toolbar Frame

ROW MARKER ADJUSTMENTS

The row marker length is determined by multiplying the number of rows by the row spacing (in inches). This figure should be equal to the distance from the end of the marker blade to the center line of the planter. Both the planter and the marker assembly should be lowered to the ground when measurements are taken. The measurement should be taken from the point where the blade contacts the ground. Adjust the left and right row markers equally to the determined length and securely tighten the clamping bolts.

Example:

of Rows x Row Spacing (inches) = Dimension
between Planter Center line and
Marker Disc Blade.

6 rows x 30" row spacing = 180".

Row marker extension from center of planter to end of row marker blade should be 180".

WARNING To avoid injury, stand clear and keep others away when raising or lowering markers. Lock row markers for transport using the locking sleeve or locking pin.

WARNING Use extreme care when operating the row markers near electrical lines.

WARNING
Hydraulic fluid escaping under pressure can penetrate the skin causing serious injury. Relieve pressure before disconnecting hydraulic lines. Tighten connections before applying pressure. If injured by escaping hydraulic fluid see a doctor at once. Gangrene can result. Wear proper hand and eye protection when searching for leaks. Use wood or cardboard instead of hands.

MARKER SPEED ADJUSTMENT

Markers come standard with automatic sequence valves. A flow control valve controls the lowering and raising speed of the markers. To adjust the marker speed, loosen the jam nut and turn the control clockwise, or in, to slow the travel speed. Turn the control counterclockwise, or out, to increase the travel speed. The adjusting bolt determines the amount of oil flow restriction through the flow control valve, therefore determining travel speed of the markers.

DANGER The flow controls should be properly adjusted before the marker assembly is first put into use. Excessive travel speed of the markers can be dangerous and/ or damage the marker assembly.

NOTE: When oil is cold, hydraulics operate slowly. Make sure all adjustments are made with warm oil.

NOTE: On a tractor where the oil flow can not be controlled, the rate of flow of oil from the tractor may be greater than the rate at which the marker cylinder can accept it. The tractor hydraulic control lever will have to be held until the cylinder reaches the end of its stroke. This occurs most often on tractors with an open center hydraulic system.

On tractors with a closed center hydraulic system, the tractor's hydraulic flow control can be set so the tractor's detent will function properly.

Single central marker sequence valve

ROW MARKERS

7" x 7" Toolbar Frame

MARKER SEQUENCING, FLOW CONTROL VALVE Valve Block Assembly Inspection

The valve block assembly consists of the marker sequencing and flow control valves in one assembly. The sequencing valve consists of a chambered body containing a spool and series of check valves to direct hydraulic oil flow. Should the valve malfunction, the components may be removed for inspection as follows:

1. Remove valve block assembly from planter.
2. Remove detent assembly and port adapter assemblies from rear of valve block.
3. Remove plug from both sides of valve block and remove spool.
4. Inspect all parts for pitting, contamination or foreign material. Also check seating surfaces inside the valve. Replace any parts found to be defective.
5. Lubricate spool with a light oil and reinstall. Check to be sure spool moves freely in valve body.

Important: Make sure the correct check ball(s) and spring are installed in each valve bore before reassembly.

PART No.	DESCRIPTION
KA5552	Valve assembly complete
KA5572	Flow control portion only
K10001	Hex head cap screws, 3/8" -16x 1"

KR1043	1/4" steel ball
KR1044	7/16" check ball
KR1045	O-ring
KR1046	Compression spring
KR1047	Hex socket plug with O-ring
KR1048	Hex jam nut, 1/2" -20

HYDRAULIC MARKER SYSTEM– Single Valve

With the single valve marker system, both markers can be used at the same time by first lowering the marker and moving the hydraulic control lever to the raise position and immediately returning it to the lower position. This will shift the marker control valve spool and the remaining marker will be lowered. This is useful in planting contours and terraces.

An additional control is required for the optional lift assist package unless it is tied into the tractor 3-point lift system. Check with you tractor dealer for parts required.

WARNING Always stand clear of marker assemblies and blades when planter is operating.

WARNING Always position lockups in "Safety" position when transporting or storing planter.

DANGER If a marker or wing lift cylinder has been removed for any reason, do not attach the rod end of the cylinder until the cylinder is cycled several times to remove any air that may be trapped in the system.

DANGER Serious injury or death can result from contact with electric lines. Use care to avoid contact with electric lines when moving or operating this machine.

TROUBLESHOOTING

If both markers are lowering, but only one is raising at a time

- The hoses from the cylinders to the valve may be connected backwards. Check the hose diagram in manual to correct.

If the same marker is always operating,

- The spool in sequencing valve may not be shifting. Remove spool and inspect for foreign material to make sure all ports in the spool are open. Clean spool and reinstall.

If both markers lower and raise at the same time

- There may be foreign material under the check ball in the sequencing valve. Remove and clean the hose fitting, spring and balls. Remove and clean the spool as well.
- Make sure there is not a ball missing or incorrectly installed I the sequencing valve. Disassemble and correct if this is the case.

Increase hydraulic flow, spool may not be shifting.

If the marker is setting down while in the raised position,

- The O-ring in the marker cylinder may be damaged or the piston may be cracked. Disassemble the cylinder to inspect for damage, repair any damage.
- The spool in sequencing valve may not be shifting completely because of a detent ball or because the spring is missing. Check the valve assembly and install parts as needed.
- The spool in sequencing valve may be shifting back towards the center position. Restrict the flow of hydraulic oil from the tractor to the sequencing valve.

If neither marker will move

- The flow control may be closed too much. Loosen the locking nut and turn the flow control adjustment bolt out, or counterclockwise, until the desired speed is set.

If the markers are moving too fast

- The flow control may be open too much. Loosen the locking nut and turn the flow control adjustment bolt in, or clockwise, until the desired speed is set.

If the marker operation speed is sporadically changing

- The needle may be sticking open in the flow control valve. Remove the flow control, inspect and repair or replace.

ROW MARKERS

Marker Spindle / Hub / Blade

The marker blade is installed so the concave side of the blade is outward to throw dirt away from the grease seals. The spindle bracket is slotted so the hub and blade can be angled to throw more or less dirt. To adjust the hub and spindle, loosen the hardware and move the bracket as required. Tighten the bolts to the specified torque.

IMPORTANT: A marker blade assembly that is set at a sharper angle than necessary will add unnecessary stress to the complete marker assembly and shorten the life of bearings and blades. Set the blade angle only as needed to leave a clear mark.

A field test is recommended to ensure the markers are properly adjusted. After the field test is made, make any minor adjustments necessary.

MICROSEM MICROGRANULAR INSECTICIDE SYSTEM

Twin-Row

MICROSEM SYSTEM

The microsem system meters microgranular products such as insecticide and herbicide with precision. The system is ground driven and has a positive displacement. The output is set by means of a transmission that is unaffected by a change in planting speed. The microsem system is mounted to the toolbar frame with support brackets to reduce weight on the planter unit. The microsem system with auger is equipped with a telescoping outlet, and its output starts from a minimum of 2-3 lbs/acre.

Each microsem hopper has a 33 lb. capacity and can be used with a double outlet for two row units or with a single outlet for one row unit.

The drive sprocket is mounted on the upper hex shaft. The hoses direct the granular product directly between the disc openers via drop tubes, or behind the disc openers via a spreader tube.

INSECTICIDE DROP TUBE

7085.SD Mounts on the right hand side of the unit, towards the front with a single bolt. It then curves down thru a notch cut into the shield covering the front of the double disc opener. It deposits material into the seed trench in front of the seed tube. This tube is used on the set back unit on twin-row machines. The top of the tube curves to the left to accept the feeder hose coming down on the left hand side of the parallel linkage.

7085. SU Mounts on the right hand side of the unit, towards the front with a single bolt. It then curves down thru a notch cut into the shield covering the front of the double disc opener. It deposits material into the seed trench in front of the seed tube. This tube is used on the set back unit on twin-row machines. The top of the tube extends straight up to accept the feeder hose coming through the middle of the parallel linkage.

7085.DA Mounts on the right hand side of the unit, with the same bolts that attach the disc scraper. It deposits material down in the seed trench behind the seed tube. The top of the tube points straight up.

7085.GA Mounts on the left hand side of the unit, with the same bolts that attach the disc scraper. It deposits material down in the seed trench behind the seed tube. The top of the tube points straight up.

7085.DS

Mounts on the left hand side of the unit, with the same bolts that attach the disc scraper. It deposits material down in the seed trench behind the seed tube. The top of the tube curves towards the rear to accept the feeder hose from the Air Insecticide System.

MICROSEM MICROGRANULAR INSECTICIDE SYSTEM

Twin-Row

SETTING THE OUTPUT

The output is a function of the number of rotations of the spindle of the metering boxes, which is set primarily with the double sprocket (1) and the interchangeable sprockets (2). The chart provided will assist with the setting and also indicates the sprockets to be used for the principle commercial products. The furnished information is a recommendation only.

NOTE: Avoid moisture contamination. Moisture in the product will cause hardening and could cause chain breakage. To avoid this problem, empty hoppers and store in a dry place.

NOTE: This unit should be used only with microgranulars and not with powders or granulates. It is possible to meter large granulars provided the inside auger is changed for a special one.

WARNING Agricultural chemicals can be dangerous. Improper use can result in injury to persons, animals and soil. Handle with care and follow instructions of the chemical manufacturer.

HOW TO TEST FOR INSECTICIDE RATES

Measure out a distance of 328 feet (100m).

Set the sprocket combination to: A=12, B=30, C=12. (This ratio = 0.24 or the number of Microsem shaft rotations for 1 drive wheel rotation.)

Remove the hoses from a 2-outlet hopper, placing a bag or other container to catch the product. Put the product into the Microsem hopper. Engage the Microsem and drive forward the pre-measured distance. Weigh the amount of product caught in the container and convert to grams.

Ounces x 31.103481 = grams
Inches x 2.54 = cm

Use the following formula:

$$\text{Output} = \frac{10 \times \text{quantity weighed (g)}}{\text{Inter-rows (cm)} \times 2}$$

Example:

Inter-rows = 60 cm (23.63")
Quantity weighed = 60 grams (1.929 oz)

If you require 8 kg/ha or 8 lb/acre, choose the ratio
 $\frac{8}{5} \times 0.24 = 0.384$
A=12, B=18, C=12

If you require 11 kg/ha or 11 lb/acre, choose the ratio
 $\frac{11}{5} \times 0.24 = 0.528$
A=12, B=22, C=20

$$\text{Output} = \frac{10 \times 60}{60 \times 2} = 5 \text{ kg/ha or } 5 \text{ lb/acre}$$

From the following chart, find the closest sprocket combination to achieve appropriate lbs/acre.

Note: Because of the large variety of insecticides and its density and irregularity of granulars, it is impossible to provide an exact chart. This is a close approximation only.

MICROSEM INSECTICIDE ASSEMBLY

Standard Microsem Assembly

PART No. DESCRIPTION

4501	V-bolt, 16mm
5021	Self lubricated bushing
6090	Snapping, 6mm
7085.da	Drop tube, right hand
7085.ga	Drop tube, left hand
7088.a	Lid, hopper, with clip (7088.2)
7088.2	Clip, for hopper lid
9500.a	Housing(half), metering unit (replaces old 9500 & 9501 left & right sides)
9502.d	Plastic hopper only, 25 liter, -'03
9504	Steel base (hopper to meter)
9505.a	Rubber skirt
9506	4x35 roll pins)
9507	Worm gear, lft(reqrs 6x25 roll pin)
9508	Worm gear, rht(reqrs 6x25 roll pin)
9509	roll pin)
9512	Trap door (to clean out meter unit)
9513.a	Seal for trap door
9514	Lever for trap door
9516	Spring for trap door
9517	Bolt (fastens housings together)
9519	Rubber plug
9520	Two outlet chute (towards the front)
9520.a	Two outlet chute (towards the rear)

PART No. DESCRIPTION

9520.1	Single outlet
9521	Rubber plug for side of chute
9522	Hose (specify length)
9523	Clamp/mounting bracket
9524	Elbow for single outlet
9525	End cap for bar
9548.b	Support bar(for mounting to a 5x5 bar)
9548.bs	Support bar(for mounting to a 7x7 bar)
9565	Rubber O-ring
9568	Hose clamp (for 9522)
9574	Plate for hopper (to convert to single outlet)
9645	Protective Sleeve
9661	Female half of sliding drop tube assy
9662	Male half of sliding drop tube assy
500003	Carrier bar, 8' 2" long(1-1/2" square)
500005	Carrier bar, 11' 6" long(1-1/2" square)
500007	Carrier bar, 14' 9" long(1-1/2" square)
AA	10530096 - Phillips head bolt, 6 x 25
BB	F38705 - Hex bolt, 12 x 25
CC	F38623 - Hex bolt, 8 x 60
DD	10172041 - Roll pin, 4 x 25
EE	10172043 - Roll pin, 4 x 35
FF	10172090 - Roll pin, 6 x 25
GG	10622024 - Washer, 16 x 26 x 1
HH	F40179 - 16mm nylon locknut

MICROSEM MICROGRANULAR INSECTICIDE SYSTEM

TROUBLE SHOOTING

PROBLEM:

Variations between the outlets or metering boxes.

POSSIBLE CAUSE:

- There may be foreign material mixed with the product
- ATTENTION there may be moisture in the product.
- The metering unit may have been assembled improperly.
- The outlet chute may be warped.
- The hose may be too long or bent, causing the hose to clog.

DRY FERTILIZER

3-Point Mounted Planters

The Monosem dry fertilizer system is precisely metered by use of an auger. The standard output is adjustable from 80-350 lbs/acre and up to 600 lbs/acre using a high output auger. A non-corrosive plastic hopper with drain plug has a capacity of from 2-row 500 lbs to 12-row 2900 lbs with single, double or ripples outlet hoppers. A flexible knife opener or a double disc opener applies fertilizer from a minimum of 2" to the side of the seed line.

ASSEMBLY AND ADJUSTMENT

The supports (1) of the fertilizer can be attached at two different widths on the hoppers, and can be easily attached to available spots on the bar. See diagram as shown below.

The drive is normally mounted in the center of the machine, as close as possible to the left side of the gearbox. For narrow inter-row spacing this drive can be placed on the outside of the toolbar frame. In that case, an optional bearing (#4515) can be used.

It is possible (but not necessary) to counter clamp the fertilizer opener clamps to the planting units. The two inner rows cannot always be mounted in this manner because of the hitch brackets. As half of the fertilizer knives are offset to the left and the other half are offset to the right, they can be adjusted as needed.

Note: When using double disc openers the wheels of the tractor must be perfectly centered on the inter-rows or the spring leaves will come in contact with the tires during lifting.

Note: With row spacing of less than 32" (80 cm) the double disc openers are not compatible with the standard semi-automatic hitch. Semi-automatic hitch with short shaft and pin are required, or manual hitch with pins.

Note: If the connector tubes between the hoppers are too long, they can be cut to size.

As an option, a 2-row hopper can feed 3 or 4 outlets, and a 3-row hopper can feed 4, 5, or 6 outlets. The fertilizers are then delivered with a meter specially equipped and plugs to allow certain outlets to be blocked off as desired.

The primary adjustment is set by using the lower double sprocket. **The final adjustment** is made by using one of the sprockets of the upper sprocket cluster. Outputs can thus be obtained between approximately 80 to 350 lbs/acre (80-350 kg/ha).

Different outputs can be obtained by replacing the standard auger painted blue, with a special (optional) high output auger painted red.

Because of the large variety of fertilizers and its density and irregularity of granules, it is impossible to furnish an exact setting chart. To make an initial setting, as a guide only, an output of 80 lbs/acre, approximately between 1.2 lb for each 334 feet (600-650 grams every 100 meters) is obtained with many types of fertilizers using the small lower sprocket cluster and the big upper sprocket cluster.

The placement of the fertilizer should be between 2" and 4" (6 and 10 cm) on the side of the row. A closer placement than what is recommended may cause the plant to burn and curb its growth.

Use the procedure outlined for testing the amount of fertilizer needed.

DRY FERTILIZER

3-point Mounted Planters

HOW TO TEST FOR FERTILIZER RATES

To test your desired fertilizer to determine lbs/acre use the chart below. First measure out a distance of 328 feet in a row.

1. Remove one hose from a fertilizer hopper and attach a plastic bag, or other container, under the opening in the hopper.
2. Engage the fertilizer attachment and drive forward the pre-measured distance of 328 feet (100 meters).
3. Weigh the amount of fertilizer caught in the container (in ounces).
4. Find your row spacing on the below chart, locate the approximate ounces and follow the chart up to see the approximate lbs/acre that will be applied at that setting.

CALIBRATION CHART

NOTE: Because all fertilizers do not have the same density and the granules can be irregular, it is impossible to furnish an exact setting chart.

Row Spacing	lbs per acre														
	80	90	100	110	120	130	140	150	160	170	180	190	200	210	220

30"	20	22	24	27	29	32	34	37	39	42	44	47	49	51	54
36"	24	26	29	32	35	38	41	44	47	50	53	56	59	62	65

APPLICATION RATES

The following rates were calculated with a bulk density of 65 lbs/cubic foot. This chart is for planters that are equipped with contact drive.

IMPORTANT: Fertilizer application rates can vary from the weights calculated in this chart due to different brands, temperature, humidity, etc. These settings are theoretical and approximate. Actual output may vary. To prevent application miscalculations, make a field test

LIQUID FERTILIZER

3-point Mounted Planters

PUMP MOUNTING AND HOSE ARRANGEMENT

The squeeze pump is shipped with the discharge manifold in the rearward or non-operating position. Before operating or mounting the pump, position the discharge manifold in the forward or operating position and secure by tightening the wing nuts.

The pump should always be mounted even with or lower than the fertilizer tank for accurate metering. The rate of liquid fertilizer application is determined by the combination of sprockets on the squeeze pump and the drive shafts (see chart). When changing the sprocket combinations, check that the sprockets are in alignment, that the sprocket retaining collars are tight and that the chain tension is restored.

The shut-off valves should be closed to shut off the flow when the pump is not in use, either overnight, or for an extended amount of time. Also close the valves when servicing either the pump or the hoses.

To prolong the life of the hoses, the discharge manifold must be repositioned to the rearward position when not in use to prevent hose distortion.

The discharge pump must be in the forward position when the pump is in operation. To reposition the manifold, loosen the wing nuts and slide the manifold forward and sideways or rearward as required and retighten the nuts.

DISCHARGE MANIFOLD REARWARD

DISCHARGE MANIFOLD FORWARD

WARNING

Agricultural chemicals can be dangerous. Improper use can result in injury to persons, animals, and soil. Handle with care and follow instructions of the chemical manufacturer.

IMPORTANT

If the fertilizer is placed too close to the seed, it may cause germination or seedling damage especially if used in amounts in excess of the fertilizer manufacturer's recommendations. Check with your fertilizer dealer or manufacturer for the correct amount and placement of fertilizer.

LIQUID FERTILIZER

3-point Mounted Planters

DELIVERY RATE CHART

The following delivery rate chart provides an approximate application rate only. Actual delivery will vary with temperature and the type of fertilizer being used.

Chart is shown in gallons per acre. This chart is for a pump with a 1/2" hose. For settings with a 5/16" hose, cut gal/acre in half.

Gallons per Acre

OPTIONAL PISTON PUMP

If the machine is equipped with the piston pump option, the rate of liquid fertilizer application is determined by the piston pump settings.

To adjust delivery rate, loosen the 3/8" lock nut that secured the arm with the pointer and rotate the scale flange until the pointer is over the desired scale setting. The adjustment wrench will facilitate rotation of the scale flange. Tighten the 3/8" lock nut being careful not to over tighten.

CLEANING

The tanks and all hoses are made of sturdy plastic and rubber to resist corrosion. However, the tanks, hoses and metering pump should be thoroughly cleaned with water at the end of the planting season or prior to an extended period of non-use. Do not allow fertilizer to crystallize due to cold temperature or evaporation.

On machines equipped with the piston pump, the strainer located between the piston pump and ball valve should be taken apart and cleaned daily. Remove the end cap to clean the screen

PISTON PUMP STORAGE

KEEP AIR OUT OF THE PUMP! This is the only way to prevent corrosion. Even for short periods of storage, the entrance of air into the pump will cause **RAPID AND SEVERE CORROSION.**

Overnight Storage

Suspension Fertilizer must be flushed from the pump for ANY storage period.

Winter Storage

1. Flush pump thoroughly with 5 to 10 gallons of fresh water and circulate until all corrosive salts are dissolved in the pump.
2. With the pump set on 10, draw in a mixture of half diesel fuel and half 10 weight oil until the discharge is clean. Then plug inlet and outlet

12-row 38"	3	5	6.5	8.5	10	12	13.5	15	17

The above chart is for planters equipped with ground drive wheels that have 7.60 x 15 tires , 26 tooth drive sprocket, and a 22 tooth driven. This chart is based on average wheel slippage and liquid viscosities. This chart is also based on standard pump sprockets of 30 tooth drive and 16 tooth driven. Other sprockets are available.

Measure and weigh one gallon of actual fertilizer solution to determine exact application rates. This chart was calculated based on a solution weighing 10 pounds per gallon.

IMPORTANT: Fertilizer application rates can vary from the above chart. To prevent application miscalculation, make field checks to be sure you are applying fertilizer to all rows at the desired rate.

NOTE: Flow to all rows should be checked periodically. If one or more lines are plugged, the desired rate will be delivered to the remaining rows keeping total application rate at desired rate.

To check the exact number of gallons your fertilizer attachment will actually deliver on 30" row spacing, proceed as follows:

1. Remove the hose from one of the fertilizer openers and insert it into a collection container that has been secured to the planter frame.
2. Engage the fertilizer attachment and drive forward for 174'.
3. Measure the fluid ounces caught in the container and multiply that amount by 100.
4. Divide that amount by 128.
5. The result will be the gallons of fertilizer delivered per acre when planting in 30" rows. Rinse the collection container and repeat test on other rows if necessary. To convert this delivery rate for wider rows, multiply by the following conversion factors:

For 36" rows, multiply by .83 by result

For 38" rows, multiply by .79 by result

TROUBLESHOOTING

PROBLEM: Pump hard or impossible to prime

POSSIBLE CAUSE SOLUTION
 Valves fouled or in wrong place. Inspect and clean valves.
 Air leak in suction line. Repair leak.
 Pump is set too low. Adjust pump setting.
 Packing washers are worn out. Replace.

PROBLEM: Low metering.

POSSIBLE CAUSE SOLUTION
 Valves are fouled or in wrong place. Inspect and clean valves.
 Air leak in suction line. Repair leak.
 Pump is set too low. Adjust pump setting.
 Broken valve spring. Replace spring.

PROBLEM: Over meters.

POSSIBLE CAUSE SOLUTION
 Broken discharge valve spring. Replace spring.
 Trash is under valves. Inspect and clean valves.
 Improper rate setting. Adjust pump setting.

PROBLEM: Leaks through when stopped.

POSSIBLE CAUSE SOLUTION
 Broken discharge valve spring. Replace spring.
 Trash is under valves. Inspect and clean valves.

PROBLEM: Fertilizer solution leaking under stuffing box.

POSSIBLE CAUSE SOLUTION
 Packing washers are worn out. Replace.

PROBLEM: Pump is using excessive oil.

POSSIBLE CAUSE SOLUTION
 Oil seals or o-ring worn and leaking. Replace.

PROBLEM: Pump operates noisily.

POSSIBLE CAUSE SOLUTION
 Crankcase components worn excessively. Inspect and replace if necessary.
